# Transformation of BL-general Fuzzy Automata 

A. Saeidi Rashkolia ${ }^{* \dagger}$, M. Shamsizadeh $\ddagger$<br>Received Date: 2016-11-28 Revised Date: 2017-07-19 Accepted Date: 2018-05-18

#### Abstract

In this paper, we prove that any BL-general fuzzy automaton (BL-GFA) and its quotient have the same behavior. In addition, we obtain the minimal quotient BL-GFA and minimal quotient transformation of the BL-GFA, considering the notion of maximal admissible partition. Furthermore, we show that the number of input symbols and time complexity of the minimal quotient transformation of a BL-GFA are less than the minimal quotient BL-GFA.

Keywords : Homomorphism; Strong homomorphism; BL-general fuzzy automata; Quotient BL-general fuzzy automata; Transformation of BL-general fuzzy automata.

## 1 Introduction

ZZadeh in 1965 [19] introduced the notion of fuzzy set as a method for representing uncertainty. Fuzzy set theory has become more and more mature in many fields such as fuzzy relation, fuzzy logic, fuzzy decision-making, fuzzy classification, fuzzy pattern recognition, fuzzy control, fuzzy optimization and fuzzy automata. The theory of fuzzy automata was introduced by Wee [17] in 1967 and Santos in 1968 [13]. E.T. Lee and L.A. Zadeh in 1969 [8] gave the concept of fuzzy finite state automata. Fuzzy finite automata have many important applications in the learning system, pattern recognition, neural networks, database theory and fuzzy discrete event systems $[3,5,6,9,10,11,12,18,14]$. M. Doost-

[^0]fatemeh and S.C. Kremer in 2005 [4] extended the notion of fuzzy automata and gave the notion of general fuzzy automata. Basic logic (BL) has been introduced by Hajek [7] in order to provide a general framework for formalizing statements of fuzzy nature. In 2012, Kh. Abolpour and M. M. Zahedi [2] extended the notion of general fuzzy automata and gave the notion of BL-general fuzzy automata.

In this paper, we define the concepts of homomorphism and strong homomorphism for a BLgeneral fuzzy automaton. A connection between strong homomorphism and admissible partition is presented. We present a quotient of the BL-GFA using the notion of strong homomorphism. Also, we show that this quotient BL-GFA and quotient BL-GFA defined in Definition 3.8 [15] have the same behavior. Then, we obtain the minimal quotient BL-general fuzzy automaton and minimal quotient transformation of BL-general fuzzy automaton considering the notions of maximal admissible partition. In addition, the authors show that the number of input symbols of the minimal
quotient transformation of BL-GFA is not more than the minimal quotient BL-GFA. Therefore, the number of transitions and calculation of the minimal quotient transformation of a BL-GFA is not more than the minimal quotient BL-GFA.

## 2 Preliminaries

In this section, we give some definitions that is used in the rest of the paper.

Definition 2.1 [7] A BL-algebra is an algebra $(L, \wedge, \vee, *, \rightarrow, 0,1)$ with four binary operations $\wedge, \vee, *, \rightarrow$ and two constants 0,1 such that: (i) $(L, \wedge, \vee, 0,1)$ is a bounded lattice, (ii) $(L, *, 1)$ is a commutative monoid, $($ iii $) *$ and $\rightarrow$ form an adjoint pair, i.e., $x \leq y \rightarrow z$ if and only if $x * y \leq z$ for all $x, y, z \in L,(i v) x \wedge y=x *(x \rightarrow y)$, $(v)(x \rightarrow y) \vee(y \rightarrow x)=1$.

Definition 2.2 [16] Let $L=(L, \vee, \wedge, 0,1)$ be a bounded complete lattice. A BL-general fuzzy automaton (BL-GFA) as a ten-tuple machine is denoted by $\tilde{F}_{l}=\left(\bar{Q}, X, \tilde{R}=\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}\right.$, $\left.\omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right)$, where
(i) $\bar{Q}=P(Q)$, where $Q$ is a finite set and $\bar{Q}$ is the power set of $Q$,
(ii) $X$ is a finite set of input symbols,
(iii) $\tilde{R}$ is the set of fuzzy start states,
(iv) $\bar{Z}$ is a finite set of output symbols, where $\bar{Z}$ is the power set of $Z$,
(v) $\omega_{l}: \bar{Q} \rightarrow \bar{Z}$ is the output function defined by: $\omega_{l}\left(Q_{i}\right)=\left\{\omega(q) \mid q \in Q_{i}\right\}$,
(vi) $\delta_{l}: \bar{Q} \times X \times \bar{Q} \rightarrow L$ is the transition function defined by: $\delta_{l}(\{p\}, a,\{q\})=\delta(p, a, q)$ and $\delta_{l}\left(Q_{i}, a, Q_{j}\right)=\vee_{q_{i} \in Q_{i}, q_{j} \in Q_{j}} \delta\left(q_{i}, a, q_{j}\right)$, for all $Q_{i}, Q_{j} \in P(Q)$ and $a \in X$,
(vii) $f_{l}: \bar{Q} \times X \rightarrow \bar{Q}$ is the next state map defined by: $f_{l}\left(Q_{i}, a\right)=\cup_{q_{i} \in Q_{i}}\left\{q_{j} \mid \delta\left(q_{i}, a, q_{j}\right) \in \Delta\right\}$,
(viii) $\tilde{\delta}_{l}:(\bar{Q} \times L) \times X \times \bar{Q} \rightarrow L$ is the augmented transition function defined $\tilde{\delta}_{l}\left(\left(Q_{i}, \mu^{t}\left(Q_{i}\right)\right), a, Q_{j}\right)=$ $F_{1}\left(\mu^{t}\left(Q_{i}\right), \delta_{l}\left(Q_{i}, a, Q_{j}\right)\right)$,
(ix) $F_{1}: L \times L \rightarrow L$ is called membership assignment function,
(x) $F_{2}: L^{*} \rightarrow L$ is called multi-membership resolution function.

Suppose that the set of all transitions of $\tilde{F}$ be $\Delta$ and $Q_{a c t}\left(t_{i}\right)$ be the set of all active states at time $t_{i}$, for all $i \geq 0$. We have $Q_{\text {act }}\left(t_{0}\right)=\tilde{R}$ and $Q_{a c t}\left(t_{i}\right)=\left\{\left(q, \mu^{t_{i}}(q)\right) \mid \exists q^{\prime} \in Q_{\text {act }}\left(t_{i-1}\right), \exists a \in\right.$ $\left.X, \delta\left(q^{\prime}, a, q\right) \in \Delta\right\}$, for all $i \geq 1$. Since $Q_{\text {act }}\left(t_{i}\right)$ is a fuzzy set, we write $q \in \operatorname{Domain}\left(Q_{\text {act }}\left(t_{i}\right)\right)$ to show that a state $q$ belongs to $Q_{a c t}\left(t_{i}\right)$ and $T$ is a subset of $Q_{a c t}\left(t_{i}\right)$. Hereafter, we denote these notations by

$$
q \in Q_{a c t}\left(t_{i}\right) \quad \text { and } \quad T \subseteq Q_{a c t}\left(t_{i}\right)
$$

In the rest of this paper, $L$ is a bounded complete lattice.

Definition 2.3 [2] Let $\tilde{F}_{l}=(\bar{Q}, X, \tilde{R}=$ $\left.\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right)$ be a $B L$ $G F A$. The run map of the BL-GFA $\tilde{F}_{l}$ is the map $\rho: X^{*} \rightarrow \bar{Q}$ defined by the following induction:
$\rho(\Lambda)=\left\{q_{0}\right\}$ and $\rho\left(a_{1} a_{2} \ldots a_{n}\right)=$ $Q_{i_{n}}, \rho\left(a_{1} a_{2} \ldots a_{n} a_{n+1}\right)=f_{l}\left(Q_{i_{n}}, a_{n+1}\right)$, where $\left(Q_{i_{n}}, \mu^{t_{0}+n}\left(Q_{i_{n}}\right)\right) \in Q_{a c t}\left(a_{1} a_{2} \ldots a_{n}\right)$ for every $a_{1}, \ldots, a_{n} \in X$.

Definition 2.4 [15] Let $\quad{\underset{\sim}{F}}_{l} \quad=$ $\left(\bar{Q}, X,\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right)$ be a BL-GFA. The behavior of $\tilde{F}_{l}$ is the map
$\beta=\omega_{l} \circ \rho: \mathcal{L}\left(\tilde{F}_{l}\right) \rightarrow \bar{Z}$, where

$$
\begin{aligned}
& \mathcal{L}\left(\tilde{F}_{l}\right)=\left\{x \in X^{*} \mid \tilde{\delta}_{l}^{*}\left(\left(\left\{q_{0}\right\}\right.\right.\right. \\
& \left.\left.\left.\quad \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), x, P\right)>0, \text { for some } P \in \bar{Q}\right\}
\end{aligned}
$$

Definition 2.5 [15] Let $\quad \underset{\sim}{F_{l}} \quad=$ $\left(\bar{Q}, X,\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right)$ be a BL-GFA and $\sim$ be an equivalence relation on $\bar{Q}$. Then $\sim$ is an admissible relation on $\bar{Q}$ if and only if the followings hold:
(i) If $Q^{\prime}, Q^{\prime \prime} \in Q_{a c t}\left(t_{i}\right), x \in X^{*}, P^{\prime} \in \bar{Q}, Q^{\prime} \sim$ $Q^{\prime \prime} \quad$ and $\quad \tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, P^{\prime}\right) \quad>\quad 0$, then there exists $P^{\prime \prime} \in \bar{Q}$ such that $\quad \tilde{\delta}_{l}^{*}\left(\left(Q^{\prime \prime}, \mu^{t_{i}}\left(Q^{\prime \prime}\right)\right), x, P^{\prime \prime}\right) \geq$ $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, P^{\prime}\right)$ and $P^{\prime} \sim P^{\prime \prime}$.
(ii) If $Q^{\prime} \sim Q^{\prime \prime}$, then $\omega_{l}\left(Q^{\prime}\right)=\omega_{l}\left(Q^{\prime \prime}\right)$.

Definition 2.6 [15] Let $\tilde{F}_{l}=$ $\left(\bar{Q}, X,\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right)$ be a $B L-G F A$ and $H=\left\{Q_{1}, \ldots, Q_{k}\right\}$ be a partition of $\bar{Q}$. Then $H$ is called an admissible partition of $\bar{Q}$ if and only if the followings hold:
(i) If $x \in X^{*}$, then for every $l_{1}$ there exists $l_{2}$, where $1 \leq l_{1}, l_{2} \leq k$. For every $P_{1}, P_{2} \in Q_{l_{1}}$ if $\tilde{\delta}_{l}^{*}\left(\left(P_{1}, \mu^{t_{i}}\left(P_{1}\right)\right)\right.$, $\left.x, R_{1}\right)>0$ for some $R_{1} \in \bar{Q}$, then there is ${\underset{\sim}{2}}_{2} \in \bar{Q}$ such that $\tilde{\delta}_{l}^{*}\left(\left(P_{2}, \mu^{t_{i}}\left(P_{2}\right)\right), x, R_{2}\right) \geq$ $\tilde{\delta}_{l}^{*}\left(\left(P_{1}, \mu^{t_{i}}\left(P_{1}\right)\right), x, R_{1}\right)$ and $R_{1}, R_{2} \in Q_{l_{2}}$.
(ii) If $Q^{\prime}, Q^{\prime \prime} \in Q_{l}$, where $1 \leq l \leq k$, then $\omega_{l}\left(Q^{\prime}\right)=\omega_{l}\left(Q^{\prime \prime}\right)$.

Definition 2.7 [15] Let $\tilde{F}_{l}$ be a BL-GFA and $\pi=\left\{H_{l} \mid l \in I\right\}$ be an admissible partition of $\bar{Q}$. Let $\pi_{1}$ be a nontrivial partition. If for every admissible partition $\pi_{2}$ of $\bar{Q}$ where $\pi_{1} \leq \pi_{2} \leq\{\bar{Q}\}$, we have either $\pi_{2}=\pi_{1}$ or $\pi_{2}=\{\bar{Q}\}$, then $\pi_{1}$ is maximal.

Definition 2.8 [15] Let $\tilde{F}_{l}$ be a BL-GFA. Then $\tilde{F}^{*}$ is called minimal, if $|\bar{Q}|>1$ and $1_{Q}$ and $\{\bar{Q}\}$ are the only admissible partitions of $\bar{Q}$.

Theorem 2.1 [15] Let $\tilde{F}_{l}$ be a BL-GFA and $\pi=$ $\left\{H_{l} \mid l \in I\right\}$ be an admissible partition of $\bar{Q}$. Then $\pi$ is maximal if and only if $\frac{\tilde{F}_{l}}{\pi}$ is minimal.

Theorem 2.2 [15] Let $\tilde{F}_{l}$ be a BL-GFA and $\pi=$ $\left\{H_{l} \mid l \in I\right\}$ be an admissible partition of $\bar{Q}$. Then $\beta_{\tilde{F}_{l}}=\beta_{\frac{\tilde{F}_{l}}{\pi}}$.

## 3 Quotient structures for BLgeneral fuzzy automata

This section attempts to introduce the concepts of homomorphism and strong homomorphism between BL-general fuzzy automata. Also, we present a quotient BL-general fuzzy automaton using the notion strong homomorphism. Finally, we obtain a minimal quotient BL-GFA.

Definition 3.1 Let $\quad \tilde{F}_{l i}$
$\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$,
$\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs. A pair $(\xi, \varphi)$ of mappings $\xi: \bar{Q}_{1} \rightarrow \bar{Q}_{2}$ and $\varphi: X_{1} \rightarrow X_{2}$ is called a homomorphism, written as $(\xi, \varphi): \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$, if

$$
\begin{aligned}
& \tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, Q^{\prime \prime}\right) \leq \\
& \tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\left(\xi\left(Q^{\prime}\right)\right)\right), \varphi(a), \xi\left(Q^{\prime \prime}\right)\right),
\end{aligned}
$$

and $\tilde{\omega}_{l 1}\left(Q^{\prime}\right) \subseteq \tilde{\omega}_{l 2}\left(\xi\left(Q^{\prime}\right)\right)$ for every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}_{l 1}$ and $a \in X_{1} \cup \Lambda$.

The pair $(\xi, \varphi)$ is called a strong homomorphism if

$$
\begin{aligned}
& \tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\left(\xi\left(Q^{\prime}\right)\right)\right), \varphi(a), \xi\left(Q^{\prime \prime}\right)\right) \\
& \quad=\vee\left\{\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R\right) \mid \xi(R)=\xi\left(Q^{\prime \prime}\right)\right\},
\end{aligned}
$$

and $\tilde{\omega}_{l 1}\left(Q^{\prime}\right)=\tilde{\omega}_{l 2}\left(\xi\left(Q^{\prime}\right)\right)$ for every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}_{l 1}$ and $a \in X_{1} \cup\{\Lambda\}$.

A homomorphism (strong homomorphism) $(\xi, \varphi): \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ is called an isomorphism (strong isomorphism), if $\xi$ and $\varphi$ are both oneone and onto.
Theorem 3.1 Let $\quad \tilde{F}_{l i} \quad=$ $\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs. Let $(\xi, \varphi): \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ be a strong homomorphism. If $\tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\left(\xi\left(Q^{\prime}\right)\right)\right), \varphi(a), \xi(R)\right)>0$, then there exists $R^{\prime} \in \bar{Q}_{l 1}$ such that $\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R^{\prime}\right)>$ 0 and $\xi\left(R^{\prime}\right)=\xi(R)$ for every $Q^{\prime}, R \in \bar{Q}_{l 1}$ and $a \in X_{1} \cup\{\Lambda\}$. Also, if $\xi\left(Q^{\prime}\right)=\xi\left(Q^{\prime \prime}\right)$ and $\tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\left(\xi\left(Q^{\prime}\right)\right)\right), \varphi(a), \xi(R)\right)>0$, then $\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R^{\prime}\right) \geq \tilde{\delta}_{l 1}\left(\left(Q^{\prime \prime}, \mu^{t}\left(Q^{\prime \prime}\right)\right), a, R\right)$, for some $R^{\prime} \in \bar{Q}_{l 1}$.
Proof. By Definition 3.1, we have

$$
\begin{aligned}
& \tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\right.\right.\left.\left.\left(\xi\left(Q^{\prime}\right)\right)\right), \varphi(a), \xi(R)\right) \\
&=\bigvee\left\{\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R^{\prime}\right)\right. \\
&\left.\mid \xi(R)=\xi\left(R^{\prime}\right)\right\}>0 .
\end{aligned}
$$

Therefore, there exists $R^{\prime} \in \bar{Q}_{l 1}$ such that $\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R^{\prime}\right)>0$ and $\xi(R)=\xi\left(R^{\prime}\right)$. Now, let $\tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\left(\xi\left(Q^{\prime}\right)\right)\right), a, \xi(R)\right)>0$. Then there exists $R^{\prime} \in \bar{Q}_{l 1}$ such that $\xi(R)=$ $\xi\left(R^{\prime}\right)$ and

$$
\begin{aligned}
& \tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R^{\prime}\right) \\
&=\tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\left(\xi\left(Q^{\prime}\right)\right)\right), a, \xi(R)\right) \\
& \quad=\tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime \prime}\right), \mu^{t}\left(\xi\left(Q^{\prime \prime}\right)\right)\right), a, \xi(R)\right) \\
& \quad \geq \tilde{\delta}_{l 1}\left(\left(Q^{\prime \prime}, \mu^{t}\left(Q^{\prime \prime}\right)\right), a, R\right) .
\end{aligned}
$$

Hence, the claim holds.

Definition 3.2 Let $\tilde{F}_{l}=(\bar{Q}, X, \tilde{R}=$ $\left.\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \quad \omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right) \quad$ be $\quad a$ $B L-G F A$ and $\sim$ be an admissible relation on $\bar{Q}$. We define $\left[Q^{\prime}\right]=\left\{P \mid P \sim Q^{\prime}\right\}$ for every $Q^{\prime} \in \bar{Q}$. Now, consider the following notations:
(i) $\frac{\bar{Q}}{\sim}=\left\{\left[Q^{\prime}\right] \mid Q^{\prime} \in \bar{Q}\right\}$ is a finite set of states,
(ii) $X$ is a finite set of input symbols,
(iii) $\frac{\tilde{R}}{\sim}=\left[\left\{q_{0}\right\}\right]$ is the set of fuzzy start states,
(iv) $\bar{Z}$ is a finite set of output symbols, where $\bar{Z}$ is the power set of $Z$,
(v) $\frac{\omega_{l}}{\sim}: \frac{\bar{Q}}{\sim} \rightarrow \bar{Z}$ is the output function defined by: $\frac{\omega_{l}}{\sim}\left(\left[Q_{i}\right]\right)=\omega_{l}\left(Q_{i}\right)$,
(vi) $\frac{\delta_{l}}{\sim}: \frac{\bar{Q}}{\sim} \times X \times \frac{\bar{Q}}{\sim} \rightarrow L$ is the transition function defined by: $\frac{\delta_{l}}{\sim}\left(\left[Q^{\prime}\right], a,\left[Q^{\prime \prime}\right]\right)=$ $\vee\left\{\delta_{l}\left(Q^{\prime}, a, R^{\prime}\right) \mid R^{\prime} \quad \sim \quad Q^{\prime \prime}\right\}$ for every $Q^{\prime}, Q^{\prime \prime}, R^{\prime} \in \bar{Q}, a \in X$,
(vii) $f_{l}: \frac{\bar{Q}}{\sim} \times X \rightarrow P\left(\frac{\bar{Q}}{\sim}\right)$ is the next state map defined by: $f_{l}\left(\left[Q_{i}\right], a\right)=$ $\cup_{R^{\prime} \sim Q_{i}}\left\{R \mid \delta\left(R^{\prime}, a, R\right) \in \Delta\right\}$,
(viii) $\left.\underset{\text { the }}{\frac{\tilde{\delta}_{l}}{\tilde{N}}: ~} \underset{\text { augmented }}{\left(\frac{\bar{Q}}{\sim}\right.} \times L\right) \times X \times \underset{\text { transition }}{\underset{\sim}{\sim}} \rightarrow \quad L$ is defined $\quad \frac{\tilde{\delta}_{l}}{\sim}\left(\left(\left[Q^{\prime}\right], \mu^{t}\left(\left[Q^{\prime}\right]\right), a,\left[Q^{\prime \prime}\right]\right)=\right.$ $\bigvee\left\{\tilde{\delta}_{l}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R^{\prime}\right) \mid R^{\prime} \sim Q^{\prime \prime}\right\}$,
(ix) $F_{1}: L \times L \rightarrow L$ is the membership assignment function,
(x) $F_{2}: L^{*} \rightarrow L$ is the multi-membership resolution function.

Now, we show that $\frac{\tilde{\delta}_{l}}{\sim}$ is well-defined. Let $\left[Q^{\prime}\right]=\left[P^{\prime}\right], a=b$ and $\left[Q^{\prime \prime}\right]=\left[P^{\prime \prime}\right]$, where $P^{\prime}, Q^{\prime}, Q^{\prime \prime}, P^{\prime \prime} \in \bar{Q}$ and $a, b \in X$. Then $P^{\prime} \sim Q^{\prime}$ and $P^{\prime \prime} \sim Q^{\prime \prime}$. So, $\frac{\tilde{\delta}_{l}}{\sim}\left(\left(\left[Q^{\prime}\right], \mu^{t}\left(\left[Q^{\prime}\right]\right)\right), a,\left[Q^{\prime \prime}\right]\right)=$
$\bigvee\left\{\tilde{\delta}_{l}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R\right) \mid R \sim Q^{\prime \prime}\right\}$ and

$$
\begin{aligned}
& \frac{\tilde{\delta}_{l}}{\sim}\left(\left(\left[P^{\prime}\right], \mu^{t}\left(\left[P^{\prime}\right]\right)\right), b,\left[P^{\prime \prime}\right]\right) \\
& \quad=\frac{\tilde{\delta}_{l}}{\sim}\left(\left(\left[P^{\prime}\right], \mu^{t}\left(\left[P^{\prime}\right]\right)\right), a,\left[P^{\prime \prime}\right]\right) \\
& \quad=\bigvee\left\{\tilde{\delta}_{l}\left(\left(P^{\prime}, \mu^{t}\left(P^{\prime}\right)\right), a, R^{\prime}\right) \mid R^{\prime} \sim P^{\prime \prime}\right\} .
\end{aligned}
$$

Let $R \sim Q^{\prime \prime}$ such that $\tilde{\delta}_{l}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R\right)>$ 0 . Then there is $R^{\prime} \in \bar{Q}$ such that $\tilde{\delta}_{l}\left(\left(P^{\prime}, \mu^{t}\left(P^{\prime}\right)\right), a, R^{\prime}\right) \geq \tilde{\delta}_{l}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R\right)$ and $R \sim R^{\prime}$. Also, if $\tilde{\delta}_{l}\left(\left(P^{\prime}, \mu^{t}\left(P^{\prime}\right)\right), a, R^{\prime}\right)>0$, where $P^{\prime}, R^{\prime} \in \bar{Q}, a \in X$ and $R^{\prime} \sim P^{\prime \prime}$, then there exists $R \in \bar{Q}$ such that $\tilde{\delta}_{l}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R\right) \geq$ $\tilde{\delta}_{l}\left(\left(P^{\prime}, \mu^{t}\left(P^{\prime}\right)\right), a, R^{\prime}\right)$ and $R \sim R^{\prime}$. Therefore,

$$
\begin{aligned}
& \frac{\tilde{\delta}_{l}}{\sim}\left(\left(\left[Q^{\prime}\right], \mu^{t}\left(\left[Q^{\prime}\right]\right)\right), a,\left[Q^{\prime \prime}\right]\right) \\
& \quad=\frac{\tilde{\delta}_{l}}{\sim}\left(\left(\left[P^{\prime}\right], \mu^{t}\left(\left[P^{\prime}\right]\right)\right), a,\left[P^{\prime \prime}\right]\right) .
\end{aligned}
$$

Hence, $\frac{\tilde{\delta}_{l}}{\sim}$ is well-defined.
Clearly, $\frac{\omega_{l}}{\sim}$ is well-defined. Then $\frac{\tilde{F}_{l}}{\sim}=\left(\frac{\bar{Q}}{\sim}, X, \frac{\tilde{R}}{\sim}=\left(\left[\left\{q_{0}\right\}\right], \mu^{t_{0}}\left(\left[\left\{q_{0}\right\}\right]\right)=\right.\right.$ $\left.\left.\mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \frac{\omega_{l}}{\sim}, \frac{\delta_{l}}{\sim}, \frac{f_{l}}{\sim}, \frac{\tilde{\delta}_{l}}{\sim}, F_{1}, F_{2}\right) \quad$ is a BLGFA.
Now, define $\xi: \bar{Q} \rightarrow \frac{\bar{Q}}{\sim}$ by $\xi\left(Q^{\prime}\right)=\left[Q^{\prime}\right]$ for every $Q^{\prime} \in \bar{Q}$. It is clear that $\xi$ is onto. Let $\varphi: X \rightarrow X$ be the identity map, $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}$ and $a \in X$. Then

$$
\begin{aligned}
& \frac{\tilde{\delta}_{l}}{\sim}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t}\left(\xi\left(Q^{\prime}\right)\right)\right), \varphi(a), \xi\left(Q^{\prime \prime}\right)\right) \\
& \quad=\frac{\tilde{\delta}_{l}}{\sim}\left(\left(\left[Q^{\prime}\right], \mu^{t}\left(\left[Q^{\prime}\right]\right)\right), a,\left[Q^{\prime \prime}\right]\right) \\
& \quad=\vee\left\{\tilde{\delta}_{l}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, P^{\prime \prime}\right) \mid P^{\prime \prime} \sim Q^{\prime \prime}\right\} \\
& \quad \geq \tilde{\delta}_{l}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, Q^{\prime \prime}\right) .
\end{aligned}
$$

Also, we have $\frac{\tilde{\omega}_{l}}{\sim}\left(\xi\left(Q^{\prime}\right)\right)=\omega_{l}\left(Q^{\prime}\right)$. Hence, $(\xi, \varphi)$ is a homomorphism.

Example 3.1 Let $(L, \wedge, \vee, 0,1)$ be the given complete lattice in Figure 1.

Let general fuzzy automaton $\tilde{F}=$ $\left(Q, X, \tilde{\delta}, \tilde{R}, Z, \omega, F_{1}, F_{2}\right) \quad$ as: $\quad Q=\left\{q_{0}, q_{1}\right\}$

Figure 1: The complete lattice $L$ of Example 3.1
$\tilde{R}=\left\{\left(q_{0}, 1\right)\right\}, X=\left\{\sigma_{1}, \sigma_{1}\right\}, Z=\{z\}, \omega\left(q_{0}\right)=$ $\omega\left(q_{1}\right)=z$ and

$$
\begin{array}{ll}
\delta\left(q_{0}, \sigma_{1}, q_{0}\right)=a, & \delta\left(q_{0}, \sigma_{1}, q_{1}\right)=b, \\
\delta\left(q_{1}, \sigma_{1}, q_{0}\right)=d, & \delta\left(q_{1}, \sigma_{1}, q_{1}\right)=e, \\
\delta\left(q_{1}, \sigma_{2}, q_{0}\right)=d, & \delta\left(q_{1}, \sigma_{2}, q_{1}\right)=e .
\end{array}
$$

Then considering Definition 3.2, we have BLgeneral fuzzy automaton $\tilde{F}_{l}$ as follow:
$\tilde{F}_{l}=\left(\bar{Q}, X,\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right)$, where $\bar{Q}=\left\{\emptyset,\left\{q_{0}\right\},\left\{q_{1}\right\},\left\{q_{0}, q_{1}\right\}\right\}, \bar{Z}=\{\emptyset,\{z\}\}$, $\omega_{l}\left(\left\{q_{0}\right\}\right)=\omega_{l}\left(\left\{q_{1}\right\}\right)=\omega_{l}\left(\left\{q_{0}, q_{1}\right\}\right)=\{z\}$ and

$$
\begin{aligned}
& \delta_{l}\left(\left\{q_{0}\right\}, \sigma_{1},\left\{q_{0}\right\}\right)=a, \\
& \delta_{l}\left(\left\{q_{0}\right\}, \sigma_{1},\left\{q_{1}\right\}\right)=b, \\
& \delta_{l}\left(\left\{q_{0}\right\}, \sigma_{1},\left\{q_{0}, q_{1}\right\}\right)=b, \\
& \delta_{l}\left(\left\{q_{1}\right\}, \sigma_{1},\left\{q_{0}\right\}\right)=d, \\
& \delta_{l}\left(\left\{q_{1}\right\}, \sigma_{1},\left\{q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{1}\right\}, \sigma_{1},\left\{q_{0}, q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\}, \sigma_{1},\left\{q_{0}\right\}\right)=d, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\}, \sigma_{1},\left\{q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\}, \sigma_{1},\left\{q_{0}, q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{1}\right\}, \sigma_{2},\left\{q_{0}\right\}\right)=d, \\
& \delta_{l}\left(\left\{q_{1}\right\}, \sigma_{2},\left\{q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{1}\right\}, \sigma_{2},\left\{q_{0}, q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\}, \sigma_{2},\left\{q_{0}\right\}\right)=d, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\}, \sigma_{2},\left\{q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\}, \sigma_{2},\left\{q_{0}, q_{1}\right\}\right)=e .
\end{aligned}
$$

 $\left.\left.\mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \frac{\omega_{l}}{\sim}, \frac{\delta_{l}}{\sim}, \frac{f_{l}}{\sim}, \frac{\tilde{l}_{l}}{\sim}, F_{1}, F_{2}\right), \quad$ where $\frac{\bar{Q}}{\sim}=\left\{\left[\left\{q_{0}\right\}\right],\left[\left\{q_{1}\right\}\right]\right\}, \frac{\omega_{l}}{\sim}\left[\left\{q_{0}\right\}\right]=\frac{\omega_{l}}{\sim}\left[\left\{q_{1}\right\}\right]=\{z\}$ and

$$
\begin{aligned}
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{1},\left[\left\{q_{0}\right\}\right]\right)=a, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{1},\left[\left\{q_{1}\right\}\right]\right)=b, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{1},\left[\left\{q_{0}\right\}\right]\right)=d, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{1},\left[\left\{q_{1}\right\}\right]\right)=e, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{2},\left[\left\{q_{0}\right\}\right]\right)=d, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{2},\left[\left\{q_{1}\right\}\right]\right)=e .
\end{aligned}
$$

Now, let $\xi: \bar{Q} \rightarrow \frac{\bar{Q}}{\sim}$, where $\xi\left(\left\{q_{0}\right\}\right)=$ $\left[\left\{q_{0}\right\}\right], \xi\left(\left\{q_{1}\right\}\right)=\xi\left(\left\{q_{0}, q_{1}\right\}\right)=\left[\left\{q_{1}\right\}\right]$ and $\varphi:$ $X \rightarrow X$ be the identity map. It is clear that $(\xi, \varphi)$ is an onto strong homomorphism.

Definition 3.3 Let $\quad \tilde{F}_{l i} \quad=$ $\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs. Let $\xi: \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ be a strong homomorphism. Then the kernel of $\xi$, denoted by $\mathrm{Ker} \xi$, is defined to be the set $\operatorname{Ker} \xi=\left\{\left(Q^{\prime}, Q^{\prime \prime}\right) \mid \xi\left(Q^{\prime}\right)=\xi\left(Q^{\prime \prime}\right)\right\}$, where $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}_{l 1}$.

Theorem 3.2 $\mathrm{Ker} \mathrm{\xi}$ is an admissible relation.
Proof. It is clear that $\operatorname{Ker} \xi$ is an equivalence relation. Let $Q^{\prime}, Q^{\prime \prime} \quad \in$ $\bar{Q}_{l 1 a c t}\left(t_{i}\right), P^{\prime} \in \bar{Q}_{l 1},\left(Q^{\prime}, Q^{\prime \prime}\right) \in \operatorname{Ker\xi }$ and $\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), a, P^{\prime}\right)>0$. Then $\xi\left(Q^{\prime}\right)=\xi\left(Q^{\prime \prime}\right)$ and

$$
\begin{aligned}
& \tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime \prime}\right), \mu^{t_{i}}\left(\xi\left(Q^{\prime \prime}\right)\right)\right), a, \xi\left(P^{\prime}\right)\right) \\
& \quad=\tilde{\delta}_{l 2}\left(\left(\xi\left(Q^{\prime}\right), \mu^{t_{i}}\left(\xi\left(Q^{\prime}\right)\right)\right), a, \xi\left(P^{\prime}\right)\right) \\
& \quad \geq \tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), a, P^{\prime}\right)>0 .
\end{aligned}
$$

According Theorem 3.1, there exists $P^{\prime \prime} \in \bar{Q}$ such that $\tilde{\delta}_{l 1}\left(\left(Q^{\prime \prime}, \mu^{t_{i}}\left(Q^{\prime \prime}\right)\right), a, P^{\prime \prime}\right) \geq$ $\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), a, P^{\prime}\right)$, where $\xi\left(P^{\prime \prime}\right)=\xi\left(P^{\prime}\right), a \in$
$X \cup\{\Lambda\}$. Now, let $\left(Q^{\prime}, Q^{\prime \prime}\right) \in \operatorname{Ker} \xi$. Then $\xi\left(Q^{\prime}\right)=\xi\left(Q^{\prime \prime}\right)$. Since $\xi$ is a strong homomorphism, $\omega_{l 1}\left(Q^{\prime}\right)=\omega_{l 2}\left(\xi\left(Q^{\prime}\right)\right)=\omega_{l 2}\left(\xi\left(Q^{\prime \prime}\right)\right)=$ $\omega_{l 1}\left(Q^{\prime \prime}\right)$. Hence, $\xi$ is an admissible relation.
Theorem 3.3 Let $\quad \tilde{F}_{l i} \quad \tilde{\delta}_{l i}=$ $\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs and $\xi^{\prime}: \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ be an onto strong homomorphism. Then there exists a strong isomorphism

$$
\gamma: \frac{\tilde{F}_{l 1}}{K e r \xi^{\prime}} \rightarrow \tilde{F}_{l 2}
$$

such that $\xi^{\prime}=\gamma \circ \xi$.
Proof. Define $\gamma: \frac{\bar{Q}_{l 1}}{K e r \xi^{\prime}} \rightarrow \bar{Q}_{l 2}$ by $\gamma\left(\left[Q^{\prime}\right]\right)=$ $\xi^{\prime}\left(Q^{\prime}\right)$, for some $Q^{\prime} \in \bar{Q}_{l 1}$. First, we show that $\gamma$ is well defined. Let $\left[Q^{\prime}\right],\left[Q^{\prime \prime}\right] \in \frac{\bar{Q}_{l 1}}{\operatorname{Ker} \xi^{\prime}}$ and $\left[Q^{\prime}\right]=$ $\left[Q^{\prime \prime}\right]$. Then $\left(Q^{\prime}, Q^{\prime \prime}\right) \in \operatorname{Ker} \xi^{\prime}$. Thus, $\xi^{\prime}\left(Q^{\prime}\right)=$ $\xi^{\prime}\left(Q^{\prime \prime}\right)$. Hence, the claim holds. Now, let $Q^{\prime}, Q^{\prime \prime} \in$ $\bar{Q}_{l 1}, a \in X$ and

$$
\begin{aligned}
\tilde{\delta}_{l 2}((\gamma & \left.\left.\left(\left[Q^{\prime}\right]\right), \mu^{t}\left(\gamma\left(\left[Q^{\prime}\right]\right)\right)\right), a, \gamma\left(\left[Q^{\prime \prime}\right]\right)\right) \\
& =\tilde{\delta}_{l 2}\left(\left(\xi^{\prime}\left(Q^{\prime}\right), \mu^{t}\left(\xi^{\prime}\left(Q^{\prime}\right)\right), a, \xi^{\prime}\left(Q^{\prime \prime}\right)\right)\right. \\
& =\bigvee\left\{\tilde{\delta}_{l 1}\left(\left(Q^{\prime}, \mu^{t}\left(Q^{\prime}\right)\right), a, R^{\prime}\right) \mid \xi^{\prime}\left(Q^{\prime \prime}\right)=\xi^{\prime}\left(R^{\prime}\right)\right\} \\
& =\frac{\tilde{\delta}_{l 1}}{\xi^{\prime}}\left(\left(\left[Q^{\prime}\right], \mu^{t}\left(\left[Q^{\prime}\right]\right), a,\left[R^{\prime}\right]\right)\right.
\end{aligned}
$$

Also, we have $\frac{\omega_{l 1}}{\operatorname{Ker} \xi^{\prime}}\left(\left[Q^{\prime}\right]\right)=\omega_{l 1}\left(Q^{\prime}\right)$, where $Q^{\prime} \in$ $\bar{Q}_{l 1}$. So, $\gamma$ is a strong homomorphism. Clearly, $\gamma$ is one-one and onto. Therefore, $\gamma$ is a strong isomorphism.

Theorem 3.4 Let $\tilde{F}_{l i}, i=1,2$ be two $B L-G F A s$ and $\xi^{\prime}: \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ be an onto strong homomorphism. Then $\beta_{\tilde{F}_{l 1}}=\beta_{\tilde{F}_{l 2}}$.

Proof. First, we show that $\mathcal{L}\left(\tilde{F}_{l 1}\right)=\mathcal{L}\left(\tilde{F}_{l 2}\right)$. Let $x \in \mathcal{L}\left(\tilde{F}_{l 1}\right)$. Then, there exists $Q^{\prime} \in \bar{Q}_{1}$ such that $\tilde{\delta}_{l 1}\left(\left(\left\{q_{01}\right\}, \mu^{t}\left(\left\{q_{01}\right\}\right)\right), x, Q^{\prime}\right)>0$. Since $\xi^{\prime}: \tilde{F}_{l 1} \rightarrow$ $\tilde{F}_{l 2}$ is a strong homomorphism, then $x \in \mathcal{L}\left(\tilde{F}_{l 2}\right)$. It is obvious that $\mathcal{L}\left(\tilde{F}_{l 2}\right) \subseteq \mathcal{L}\left(\tilde{F}_{l 1}\right)$. Now, let $\rho_{1}$ and $\rho_{2}$ be the run relations of $\tilde{F}_{l 1}$ and $\tilde{F}_{l 2}$, respectively. Then we have $\beta_{\tilde{F}_{l 1}}=\omega_{l 1}\left(\rho_{1}(x)\right)=$ $\omega_{l 2}\left(\xi^{\prime}\left(\rho_{1}(x)\right)\right) \subseteq \omega_{l 2}\left(\rho_{2}(x)\right)=\beta_{\tilde{F}_{l 2}}$. Similarly, $\beta_{\tilde{F}_{l 2}}=\omega_{l 2}\left(\rho_{2}(x)\right)=\omega_{l 2}\left(\xi^{\prime}\left(Q^{\prime}\right)\right) \stackrel{\omega_{l 1}}{=}\left(Q^{\prime}\right) \subseteq$ $\omega_{l 1}\left(\rho_{1}(x)\right)=\beta_{\tilde{F}_{l 1}}$. Hence, $\beta_{\tilde{F}_{l 1}}=\beta_{\tilde{F}_{l 2}}$.

Example 3.2 Let $\tilde{F}_{l}, \frac{\tilde{F}_{l}}{\sim}$ be the BL-GFAs as in Example 3.1. We showed that $\xi: \tilde{F}_{l} \rightarrow \frac{\tilde{F}_{l}}{\sim}$ is an onto strong homomorphism. Then by Theorem 3.4, $\beta_{\tilde{F}_{l}}=\beta_{\frac{\tilde{F}_{l}}{\sim}}$.

## Corollary 3.1 Let

$$
\begin{gathered}
\tilde{F}_{l i}=\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right)\right. \\
\bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}
\end{gathered}
$$

$\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs and $\xi^{\prime}: \tilde{F}_{l 1} \rightarrow$ $\tilde{F}_{l 2}$ be an onto strong homomorphism. Let $\frac{\tilde{F}_{l 1}}{K e r \xi^{\prime}}$ be as defined in Definition 3.2. Then $\beta \frac{\tilde{F}_{l 1}}{\text { Ker } \xi^{\prime}}=$ $\beta_{\tilde{F}_{l 2}}$.

Proof. Considering Theorems 3.3 and 3.4, the proof is clear.

Corollary 3.2 Let $\quad \tilde{F}_{l i} \quad=$ $\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs and $\xi: \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ be a strong homomorphism. Then the set of all classes of $K e r \xi$ is an admissible partition of $\bar{Q}_{l 1}$.

Theorem 3.5 Let $\quad \tilde{F}_{l i}=$ $\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs, $\pi=\left\{H_{l} \mid l \in I\right\}$ be a maximal admissible partition of $\bar{Q}$ and $\xi^{\prime}: \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ be an onto strong homomorphism. Let $\frac{\tilde{F}_{l 1}}{\text { Ker } \xi^{\prime}}$ be as defined in Theorem 3.3, and $\frac{\tilde{F}_{l 1}}{\pi}$ be as defined in Definition 3.8 [15]. Then $\beta_{\frac{\tilde{F}_{l 1}}{\pi}}=\beta_{\frac{\tilde{F}_{l 1}}{K e r \xi^{\prime}}}$.

Proof. The proof is clear considering the proof of Theorem 3.4, Corollary 3.1, and Theorem 3.14. [15].

Theorem 3.6 Let $\quad \tilde{F}_{l i} \quad=$ $\left(\bar{Q}_{l i}, X,\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs and $\xi^{\prime}: \bar{Q}_{l 1} \rightarrow \bar{Q}_{l 2}$ be a strong homomorphism. Then Ker $\xi^{\prime}$ is a maximal admissible partition if and only if $\frac{\tilde{F}_{l 1}}{K e r \xi^{\prime}}$ is minimal.

Proof. The proof is obvious considering Theorem 3.12 of [15] and Theorem 3.2.
Example 3.3 Let $\tilde{F}_{l}, \frac{\tilde{F}_{l}}{\sim}$ be the BL-GFAs as in Example 3.1. We showed that $\xi: \tilde{F}_{l} \rightarrow \frac{\tilde{F}_{l}}{\sim}$ is an onto strong homomorphism.
There exists a strong isomorphism $\gamma: \frac{\tilde{F}_{l}}{\operatorname{Ker} \xi} \rightarrow$ $\frac{\tilde{F}_{l}}{\sim}$, using Definition 3.3, and Theorem 3.3. Obviously, $\operatorname{Ker} \xi$ is a maximal admissible partition. Therefore, by Theorem 3.6, $\frac{\tilde{F}_{l}}{\operatorname{Ker} \xi}$ is minimal. Hence, $\frac{\tilde{F}_{l}}{\sim}$ is minimal.

## 4 Transformation for BLgeneral fuzzy automata

In this section, we define an equivalence relation on $X^{*}$. Using this equivalence relation, we present a transformation of BL-GFA. Also, we obtain a minimal quotient transformation of BLGFA. Finally, we arrive in Corollary 4.2, that is one of the main results of this paper.

Definition 4.1 Let $\quad \tilde{F}_{l} \quad=$ $\left(\bar{Q}, X,\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \quad \bar{Z}, \omega_{l}, \delta_{l}, f_{l}, \tilde{\delta}_{l}, F_{1}, F_{2}\right)$ be a BL-GFA and $\equiv$ be a relation on $X^{*}$. Let $x, y \in X^{*}$. Then $x \equiv y$ if and only if $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right)=\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), y, Q^{\prime \prime}\right)$ for every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}$.

Theorem 4.1 Let $\tilde{F}_{l}$ be a $B L-G F A$. Then $\equiv$ is a congruence relation on $X^{*}$.

Proof. It is clear that $\equiv$ is an equivalence relation on $X^{*}$. Let $z \in X^{*}$ and $x \equiv y$. Then

$$
\begin{aligned}
& \tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x z, Q^{\prime \prime}\right) \\
&=\vee_{P \in \bar{Q}^{*}}^{l}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, P\right) \\
& \quad \wedge \tilde{\delta}_{l}^{*}\left(\left(P, \mu^{t_{i}}(P)\right), z, Q^{\prime \prime}\right) \\
& \quad=\vee_{P \in \bar{Q}^{*}}^{l} \tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), y, P\right) \\
& \quad \wedge \tilde{\delta}_{l}^{*}\left(\left(P, \mu^{t_{i}}(P)\right), z, Q^{\prime \prime}\right) \\
& \quad=\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), y z, Q^{\prime \prime}\right)
\end{aligned}
$$

So, $x z \equiv y z$. Similarly, $z x \equiv z y$. Hence, $\equiv$ is a congruence relation on $X^{*}$. Let $x \in X^{*}$. Then
we denote $[x]=\left\{y \in X^{*} \mid x \equiv y\right\}$ and $E\left(\tilde{F}_{l}\right)=$ $\left\{[x] \mid x \in X^{*}\right\}$.
Definition 4.2 Let $\tilde{F}_{l}$ be a BL-GFA. Define a binary operation $*$ on $E\left(\tilde{F}_{l}\right)$ by $[x] *[y]=[x y]$ for every $[x],[y] \in E\left(\tilde{F}_{l}\right)$.
Theorem 4.2 Let $\tilde{F}_{l}$ be a BL-GFA. Then $\left(E\left(\tilde{F}_{l}\right), *\right)$ is a finite monoid.

Proof. First, we show that $*$ is well-defined and associative. Let $[x]=[u]$ and $[y]=[v]$, where $[x],[y],[u],[v] \in E\left(\tilde{F}_{l}\right)$. Then $[x y]=[x] *[y]=$ $[u] *[v]=[u v]$. Also, $[x] *([y] *[z])=[x] *$ $[y z]=[x y z]=[x y] *[z]=([x] *[y]) *[z]$ for every $[x],[y],[z] \in E\left(\tilde{F}_{l}\right)$. Therefore, $\left(E\left(\tilde{F}_{l}\right), *\right)$ is well-defined and associative. Now, we have $[x] *[\Lambda]=[x \Lambda]=[x]=[\Lambda x]=[\Lambda] *[x]$ for every $[x] \in E\left(\tilde{F}_{l}\right)$. Since $\operatorname{Im}\left(\delta_{l}\right)$ is finite, $\operatorname{Im}\left(\delta_{l}^{*}\right)$ is finite. Hence, $\left(E\left(\tilde{F}_{l}\right), *\right)$ is a finite monoid.
Definition 4.3 Let $\tilde{F}_{l}$ be a BL-GFA and $u, v \in X$. Then $\tilde{F}_{l}$ is called faithful if $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), u, Q^{\prime \prime}\right)=\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), v, Q^{\prime \prime}\right)$ for every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}$, implies that $u=v$.
Example 4.1 Let $\tilde{F}_{l}$ be the BL-general fuzzy automaton as in Example 3.1. Considering Definition 4.3, $\tilde{F}_{l}$ is a faithful BL-GFA.

Theorem 4.3 Let $\tilde{F}_{l} \quad b e \quad a$ BL-GFA. Then $\quad \tilde{F}_{l E\left(\tilde{F}_{l}\right)} \quad=$ $\left(\bar{Q}, E\left(\tilde{F}_{l}\right),\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l E}, f_{l E}\right.$, $\left.\tilde{\delta}_{l E}, F_{1}, F_{2}\right) \quad$ is a faithful $\quad B L-G F A$, where $\quad \tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[x], Q^{\prime \prime}\right)=$ $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right)$, where $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}, x \in X$.

Proof. Clearly, $\quad \tilde{\delta}_{l E}$ is well-defined. Let $\quad \tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[x], Q^{\prime \prime}\right) \quad=$ $\tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[y], Q^{\prime \prime}\right)$. Then $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}\right.\right.$, $\left.\left.\mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right)=\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), y, Q^{\prime \prime}\right)$. Therefore, $x \equiv y$ and so, $[x]=[y]$. Hence, $\tilde{F}_{l E\left(\tilde{F}_{l}\right)}$ is a faithful BL-GFA.

Let $\tilde{F}_{l}$ be a BL-GFA. Then $\tilde{F}_{l E\left(\tilde{F}_{l}\right)}=$ $\left(\bar{Q}, E\left(\tilde{F}_{l}\right),\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l E}, f_{l E}, \tilde{\delta}_{l E}\right.$, $\left.F_{1}, F_{2}\right)$ is called the transformation of BL-GFA.
Example 4.2 Let $(L, \wedge, \vee, 0,1)$ be the given complete lattice in Figure 1. Consider BL-general fuzzy automaton $\tilde{F}_{l}=$ $\left(\bar{Q}, X,\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l}, f_{l}, \quad \tilde{\delta}_{l}, F_{1}, F_{2}\right)$, where
$\bar{Q}=\left\{\emptyset,\left\{q_{0}\right\},\left\{q_{1}\right\},\left\{q_{0}, q_{1}\right\}\right\}, \bar{Z}=\{\emptyset,\{z\}\}$, $\omega_{l}\left(\left\{q_{0}\right\}\right)=\omega_{l}\left(\left\{q_{1}\right\}\right)=\omega_{l}\left(\left\{q_{0}, q_{1}\right\}\right)=\{z\}$ and

$$
\begin{aligned}
& \delta_{l}\left(\left\{q_{0}\right\}, \sigma_{1},\left\{q_{0}\right\}\right)=a, \\

& \delta_{l}\left(\left\{q_{0}, q_{1}\right\}, \sigma_{2},\left\{q_{0}, q_{1}\right\}\right)=e .
\end{aligned}
$$

Then we have the transformation of BL-GFA $\tilde{F}_{l}$ as: $\quad \tilde{F}_{l E\left(\tilde{F}_{l}\right)} \quad=$ $\left(\bar{Q}, E\left(\tilde{F}_{l}\right),\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l E}\right.$,
$\left.f_{l E}, \tilde{\delta}_{l E}, F_{1}, F_{2}\right)$, where $E\left(\tilde{F}_{l}\right)=\left\{\left[\sigma_{1}\right]\right\},\left[\sigma_{1}\right]=$ $\left\{\sigma_{1}, \sigma_{2}\right\}$ and

$$
\begin{aligned}
& \delta_{l}\left(\left\{q_{0}\right\},\left[\sigma_{1}\right],\left\{q_{0}\right\}\right)=a, \\
& \delta_{l}\left(\left\{q_{0}\right\},\left[\sigma_{1}\right],\left\{q_{1}\right\}\right)=b, \\
& \delta_{l}\left(\left\{q_{0}\right\},\left[\sigma_{1}\right],\left\{q_{0}, q_{1}\right\}\right)=b, \\
& \delta_{l}\left(\left\{q_{1}\right\},\left[\sigma_{1}\right],\left\{q_{0}\right\}\right)=d, \\
& \delta_{l}\left(\left\{q_{1}\right\},\left[\sigma_{1}\right],\left\{q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{1}\right\},\left[\sigma_{1}\right],\left\{q_{0}, q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\},\left[\sigma_{1}\right],\left\{q_{0}\right\}\right)=d, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\},\left[\sigma_{1}\right],\left\{q_{1}\right\}\right)=e, \\
& \delta_{l}\left(\left\{q_{0}, q_{1}\right\},\left[\sigma_{1}\right],\left\{q_{0}, q_{1}\right\}\right)=e .
\end{aligned}
$$

Theorem 4.4 Let $\tilde{F}_{l}$ be a BL-GFA and ~ be an equivalence relation on $\bar{Q}$. Then $\sim$ is an admissible relation for $\tilde{F}_{l}$ if and only if $\sim$ is an admissible relation for $\tilde{F}_{l E\left(\tilde{F}_{l}\right)}=$ $\left(\bar{Q}, E\left(\tilde{F}_{l}\right),\left(\left\{q_{0}\right\}, \mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \omega_{l}, \delta_{l E}, f_{l E}\right.$, $\left.\tilde{\delta}_{l E}, F_{1}, F_{2}\right)$.

Proof. Let $\sim$ be an admissible relation on $\tilde{F}_{l}$ and $Q^{\prime}, Q^{\prime \prime} \in \bar{Q},[x] \quad \in$ $E\left(\tilde{F}_{l}\right), P^{\prime} \in \bar{Q}, Q^{\prime} \sim Q^{\prime \prime}$ and $\tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right)\right.$, $\left.[x], P^{\prime}\right)=\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, P^{\prime}\right)>0$. Then there exists $P^{\prime \prime} \in \bar{Q}$ such that $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime \prime}, \mu^{t_{i}}\left(Q^{\prime \prime}\right)\right), x, P^{\prime \prime}\right) \geq \tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, P^{\prime}\right)$ and $P^{\prime} \sim P^{\prime \prime}$. So, $\tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime \prime}, \mu^{t_{i}}\left(Q^{\prime \prime}\right)\right),[x], P^{\prime \prime}\right) \geq$ $\tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[x], P^{\prime}\right) . \quad$ Hence, $\sim$ is an admissible relation for $\tilde{F}_{l E\left(\tilde{F}_{l}\right)}$.

Theorem 4.5 Let $\tilde{F}_{l}$ be a BL-GFA and $\tilde{F}_{l E\left(\tilde{F}_{l}\right)}$ be a transformation of the BL-GFA. Then $\beta_{\tilde{F}_{l 1}}=$ $\beta_{\tilde{F}_{l E\left(\tilde{F}_{l}\right)}}$.

Proof. Considering Definition 2.4, and Theorem 4.3, the proof is obvious.

Theorem 4.6 Let $\tilde{F}_{l}$ be a faithful BL-GFA. Then $\tilde{F}_{l E\left(\tilde{F}_{l}\right)}$ is isomorphism to $\tilde{F}_{l}$.

Proof. Let $f: \bar{Q} \rightarrow \bar{Q}$ be an identity map. Define $g: X \rightarrow E\left(\tilde{F}_{l}\right)$ by $g(x)=[x]$ for every $Q^{\prime} \in \bar{Q}$ and $x \in X$. Let $x, y \in X^{*}$ and $g(x)=g(y)$. Then $[x]=[y] . \quad$ Thus, $\tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[x], Q^{\prime \prime}\right)=$ $\delta_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[y], Q^{\prime \prime}\right) \quad$ for $\quad$ every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q} . \quad$ So, $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right)=$ $\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), y, Q^{\prime \prime}\right)$ for every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}$. Since $\tilde{F}_{l}$ is faithful, then $x=y$. Therefore, $g$ is injective. Clearly, $g$ is surjective. Also, we have

$$
\begin{aligned}
& \tilde{\delta}_{l E}^{*}\left(\left(f\left(Q^{\prime}\right), \mu^{t_{i}}\left(f\left(Q^{\prime}\right)\right)\right), g(x), f\left(Q^{\prime \prime}\right)\right) \\
&=\tilde{\delta}_{l E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[x], Q^{\prime \prime}\right) \\
&=\tilde{\delta}_{l}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right) .
\end{aligned}
$$

Hence, $(f, g): \tilde{F}_{l} \rightarrow \tilde{F}_{l E}$ is a strong isomorphism.

Theorem 4.7 Let $\quad \tilde{F}_{l i} \quad=$ $\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs. Let $(\alpha, \beta): \tilde{F}_{l 1} \rightarrow \tilde{F}_{l 2}$ be a strong homomorphism with $\alpha$ one-one and onto. Then there exists a strong homomorphism $\left(f_{\alpha}, g_{\beta}\right): \tilde{F}_{l 1 E} \rightarrow \tilde{F}_{l 2 E}$.

Proof. Define $f_{\alpha}: \bar{Q}_{l 1} \rightarrow \bar{Q}_{l 2}$ by $f_{\alpha}\left(Q_{1}^{\prime}\right)=$ $\alpha\left(Q_{1}^{\prime}\right)$ for every $Q_{1}^{\prime} \in \bar{Q}_{l 1}$ and $g_{\beta}: E\left(\tilde{F}_{l 1}\right) \rightarrow$ $E\left(\tilde{F}_{l 2}\right)$ by $g_{\beta}([x])=\left[\beta^{*}(x)\right]$ for every $[x] \in E\left(\tilde{F}_{l 1}\right)$. Let $[x],[y] \in E\left(F_{l 1}\right)$ and $[x]=[y]$. Then $\tilde{\delta}_{l 1}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right)=\tilde{\delta}_{l 1}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), y, Q^{\prime \prime}\right)$
for every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}_{l 1}$. So,

$$
\begin{aligned}
\tilde{\delta}_{l 2}^{*}((\alpha) & \left.\left.\left(Q^{\prime}\right), \mu^{t_{i}}\left(\alpha\left(Q^{\prime}\right)\right)\right), \beta^{*}(x), \alpha\left(Q^{\prime \prime}\right)\right) \\
& =\tilde{\delta}_{l 1}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right) \\
\quad & =\tilde{\delta}_{l 1}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), y, Q^{\prime \prime}\right) \\
& =\tilde{\delta}_{l 2}^{*}\left(\left(\alpha\left(Q^{\prime}\right), \mu^{t_{i}}\left(\alpha\left(Q^{\prime}\right)\right)\right), \beta^{*}(y), \alpha\left(Q^{\prime \prime}\right)\right)
\end{aligned}
$$

for every $Q^{\prime}, Q^{\prime \prime} \in \bar{Q}_{l 1}$. Since $\alpha$ is onto, then $\left[\beta^{*}(x)\right]=\left[\beta^{*}(y)\right]$. Therefore, $g_{\beta}$ is well-defined. Also,

$$
\begin{aligned}
\tilde{\delta}_{l 2 E}^{*}( & \left.\left(f_{\alpha}\left(Q^{\prime}\right), \mu^{t_{i}}\left(f_{\alpha}\left(Q^{\prime}\right)\right)\right), g_{\beta}([x]), f_{\alpha}\left(Q^{\prime \prime}\right)\right) \\
& =\tilde{\delta}_{l 2}^{*}\left(\left(\alpha\left(Q^{\prime}\right), \mu^{t_{i}}\left(\alpha\left(Q^{\prime}\right)\right)\right), \beta^{*}(x), \alpha\left(Q^{\prime \prime}\right)\right) \\
& =\tilde{\delta}_{l 1}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right), x, Q^{\prime \prime}\right) \\
& =\tilde{\delta}_{l 1 E}^{*}\left(\left(Q^{\prime}, \mu^{t_{i}}\left(Q^{\prime}\right)\right),[x], Q^{\prime \prime}\right)
\end{aligned}
$$

Hence, $\left(f_{\alpha}, g_{\beta}\right)$ is a strong homomorphism.
Corollary 4.1 Let $\quad \tilde{F}_{l i}=$ $\left(\bar{Q}_{l i}, X_{i},\left(\left\{q_{0 i}\right\}, \mu^{t_{0}}\left(\left\{q_{0 i}\right\}\right)\right), \bar{Z}, \omega_{l i}, \delta_{l i}, f_{l i}, \tilde{\delta}_{l i}\right.$, $\left.F_{1}, F_{2}\right), i=1,2$ be two BL-GFAs and $(\alpha, \beta)$ be a strong homomorphism with $\alpha$ one-to-one and onto. Then Ker $\alpha$ is a maximal admissible partition of $\bar{Q}_{l 1}$ if and only if $\frac{\tilde{F}_{l E 1}}{K e r \alpha}$ is a minimal $B L-G F A$.

Proof. The proof is clear considering Theorems 3.6 and 4.7 .

Corollary 4.2 Let $\tilde{F}_{l i}, i=1,2$ be two $B L-G F A s$ and $(\alpha, \beta)$ be a strong homomorphism with $\alpha$ one-to-one and onto. If Ker $\alpha$ is a maximal admissible partition of $\bar{Q}_{l 1}$, then $\frac{\tilde{F}_{l 1}}{\text { Ker } \alpha}$ and $\frac{\tilde{F}_{l E 1}}{\text { Ker } \alpha}$ are minimal BL-GFA. But the number of input symbols of $\frac{\tilde{F}_{l E 1}}{\text { Ker } \alpha}$ is not more than $\frac{\tilde{F}_{l 1}}{\text { Ker } \alpha}$.

Example 4.3 Consider BL-general fuzzy automaton $\tilde{F}_{l}$ in Example 4.2. By Theorem 4.5, it is obvious that $\beta_{\tilde{F}_{l 1}}=\beta_{\tilde{F}_{l E\left(\tilde{F}_{l}\right)}}$. Consider the admissible relation $\sim$ as $\left\{q_{1}\right\} \sim\left\{q_{0}, q_{1}\right\}$. Clearly,$\sim$ is an admissible relation for $\tilde{F}_{l}$. By Theorem 4.4, $\sim$ is an admissible relation for $\tilde{F}_{l E\left(\tilde{F}_{l}\right)}$. Also, we have
$\frac{\tilde{F}_{l E\left(\tilde{F}_{l}\right)}}{\sim}=\left(\frac{\bar{Q}}{\sim}, E\left(\tilde{F}_{l}\right), \frac{\tilde{R}}{\sim}=\left(\left[\left\{q_{0}\right\}\right], \mu^{t_{0}}\left(\left[\left\{q_{0}\right\}\right]\right)=\right.\right.$ $\left.\left.\mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \frac{\omega_{l}}{\sim}, \frac{\delta_{l E}}{\sim}, \frac{f_{l}}{\sim}, \frac{\tilde{\delta}_{l}}{\sim}, F_{1}, F_{2}\right)$, where $\frac{\bar{Q}}{\sim}=$
$\left\{\left[\left\{q_{0}\right\}\right],\left[\left\{q_{1}\right\}\right]\right\}, E\left(\tilde{F}_{l}\right)=\left[\sigma_{1}\right], \quad \frac{\omega_{l}}{\sim}\left[\left\{q_{0}\right\}\right]=$ $\frac{\omega_{l}}{\sim}\left[\left\{q_{1}\right\}\right]=\{z\}$ and

$$
\begin{aligned}
& \frac{\delta_{l E}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{1},\left[\left\{q_{0}\right\}\right]\right)=a \\
& \frac{\delta_{l E}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{1},\left[\left\{q_{1}\right\}\right]\right)=b \\
& \frac{\delta_{l E}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{1},\left[\left\{q_{0}\right\}\right]\right)=d \\
& \frac{\delta_{l E}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{1},\left[\left\{q_{1}\right\}\right]\right)=e
\end{aligned}
$$

Define $\xi: \bar{Q} \rightarrow \frac{\bar{Q}}{\sim}$ by $\xi\left(\left\{q_{0}\right\}\right)=\left[\left\{q_{0}\right\}\right], \xi\left(\left\{q_{1}\right\}\right)=$ $\xi\left(\left\{q_{0}, q_{1}\right\}\right)=\left[\left\{q_{1}\right\}\right]$ and $\varphi: X \rightarrow E\left(\tilde{F}_{l}\right)$ by $\varphi\left(\sigma_{1}\right)=\left[\sigma_{1}\right]$ the identity map. Obviously, $(\xi, \varphi)$ is an onto strong homomorphism. By Definition 3.3, and Theorem 3.3, there exists a strong isomorphism $\gamma: \frac{\tilde{F}_{l E\left(\tilde{F}_{l}\right)}}{\operatorname{Ker} \xi} \rightarrow \frac{\tilde{F}_{l E\left(\tilde{F}_{l}\right)}}{\sim}$. Clearly, $\operatorname{Ker} \xi$ is a maximal admissible partition. Therefore, considering Theorem 3.6, $\frac{\tilde{F}_{l E\left(\tilde{F}_{l}\right)}}{\operatorname{Ker} \xi}$ is minimal. Hence, $\frac{\tilde{F}_{l E\left(\tilde{F}_{l}\right)}}{\sim}$ is the minimal quotient transformation of the BL-general fuzzy automaton. Also, we have $\frac{\tilde{F}_{l}}{\sim}=\left(\frac{\bar{Q}}{\sim}, X, \frac{\tilde{R}}{\sim}=\left(\left[\left\{q_{0}\right\}\right], \mu^{t_{0}}\left(\left[\left\{q_{0}\right\}\right]\right)=\right.\right.$ $\left.\left.\mu^{t_{0}}\left(\left\{q_{0}\right\}\right)\right), \bar{Z}, \frac{\omega_{l}}{\sim}, \frac{\delta_{l}}{\sim}, \frac{f_{l}}{\sim}, \frac{\tilde{\delta}_{l}}{\sim}, F_{1}, F_{2}\right)$, where $\frac{\bar{Q}}{\sim}=$ $\left\{\left[\left\{q_{0}\right\}\right],\left[\left\{q_{1}\right\}\right]\right\}, \frac{\omega_{l}}{\sim}\left[\left\{q_{0}\right\}\right]=\frac{\omega_{l}}{\sim}\left[\left\{q_{1}\right\}\right]=\{z\}$ and

$$
\begin{aligned}
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{1},\left[\left\{q_{0}\right\}\right]\right)=a, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{1},\left[\left\{q_{1}\right\}\right]\right)=b, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{1},\left[\left\{q_{0}\right\}\right]\right)=d, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{1},\left[\left\{q_{1}\right\}\right]\right)=e, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{2},\left[\left\{q_{0}\right\}\right]\right)=a, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{0}\right\}\right], \sigma_{2},\left[\left\{q_{1}\right\}\right]\right)=b, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{2},\left[\left\{q_{0}\right\}\right]\right)=d, \\
& \frac{\delta_{l}}{\sim}\left(\left[\left\{q_{1}\right\}\right], \sigma_{2},\left[\left\{q_{1}\right\}\right]\right)=e .
\end{aligned}
$$

Now, let $\xi: \bar{Q} \rightarrow \frac{\bar{Q}}{\sim}$, where $\xi\left(\left\{q_{0}\right\}\right)=$ $\left[\left\{q_{0}\right\}\right], \xi^{\prime}\left(\left\{q_{1}\right\}\right)=\xi\left(\left\{q_{0}, \widetilde{\left.q_{1}\right\}}\right)=\left[\left\{q_{1}\right\}\right]\right.$ and $\varphi:$
$X \rightarrow X$ be the identity map. Similarly, $\frac{\tilde{F}_{l}}{\sim}$ is minimal quotient BL-general fuzzy automaton.

This example showed that the number of input symbols of the minimal quotient transformation of a BL-general fuzzy automaton is less than the minimal quotient BL-general fuzzy automaton. Hence, the number of transitions and calculation of the minimal quotient transformation of a BL-general fuzzy automaton is less than the minimal quotient BL-general fuzzy automaton.

## 5 Conclusion

In this paper, a connection between strong homomorphism and admissible partition is presented. Also, we showed that any quotient of a given BL-GFA and the BL-GFA itself have the same behavior. The researchers obtained the minimal quotient BL-GFA and minimal quotient transformation of BL-GFA using the notions of maximal admissible partition. It is shown that the number of input symbols of the minimal quotient transformation of a BL-general fuzzy automaton is not more than the minimal quotient BL-general fuzzy automaton. Hence, the number of transitions and the number of computations of the minimal quotient transformation of a BL-GFA are not more than the minimal quotient BL-GFA.

## Acknowledgments

This research was financed from the budget of Islamic Azad University Kerman Branch-Iran in the form of research design of "Transformation of BL-general fuzzy automata". Therefore, the authors are highly grateful to the Department of Mathematics, Islamic Azad University, Kerman Branch, Kerman, Iran for providing an excellent research environment in which to conduct this research.

## Compliance with ethical standards

## Conflict of interest

The authors declare that they have no conflict of interest.
